We have just made available 5 PHP applications on a WISP stack (Windows Server 2008, IIS 7 (with FastCGI), SQL Server 2005, and PHP). The installers are available for download. A quick registration is required.

The 5 applications are:

- Gallery: A web-based photo album viewer/creator
- Mantis: A free popular web-based bug tracking system.
- Moodle: A free, Open Source Course (or Learning) Management System (CMS/LMS)
- phpBB: The most widely used Open Source forum solution.
- WebCalendar: Web-based calendar application.

The only prerequisites for installation are:

- Windows Server 2008 Standard or Enterprise Edition
- Microsoft SQL Server 2005 with mixed-mode authentication.

The installer should take care of the rest including installing IIS and configuring PHP through FastCGI. The applications come with updates and add-ons delivered through the free trial of our SpikeNet service.

Take them for a spin.
