Abstract:

The CERIF Semantics is one component of the CERIF 2008 - 1.1 Full Data Model (FDM). It aims at recommending a standardised formal semantics to be applied in the wider context of Current Research Information Systems (CRISs) with CERIF as the underlying data model to supply the relevant entities and their relationships. The semantic component in its current version presents the CERIF publication semantics; that is, the types of documents published in the research context, and the roles for a linkage between the involved entities.

CERIF (the Common European Research Information Format) is a formal model to support the management of Research Information and to enable interoperation between Research Information Systems. The CERIF model is considered as a standard; recommended by the European Union to its Member States. It has been developed with support by the European Commission in two major phases: 1987-1990 and 1997-1999. In 2002 the European Commission handed over care and custody of CERIF to euroCRIS (http://www.eurocris.org) a not-for-profit organisation dedicated to the promotion of CRISs (Current Research Information Systems).

Status:

This document will be updated alongside major updates of the CERIF Semantics.

1. Introduction

The presented publication semantics of types and roles is only a first step, where in the mid-term future we intend to concentrate on the semantics in the context of research funding. The current version of a CERIF Semantics for publications has been developed from feedback at Tutorial presentations, Membership Meetings, and from discussions on the CERIF TG mailinglist. Information Scientists, Librarians, Computer Scientists, Researchers, Managers, Practitioners and Engineers have presented and contributed their views summarized with this document. During communication, from research, and in meetings, it became clear that currently many different but in parts overlapping metadata schemes or terminologies exist for publications. [1] provides a comprehensive overview of existing metadata descriptions for digital libraries, among them – the two most established ones: Dublin Core¹ and MODS² – and identifies a need for their standardisation. The CERIF Semantics aims at recommending a standardised formal semantics to be applied in the wider context of Current Research Information Systems (CRISs), including the domain of scholarly publications or digital libraries, with CERIF as the underlying data model to supply the involved entities and their relationships. The CERIF Semantics is one component of the CERIF 2008 – 1.1 Full Data Model (FDM).

2. CERIF Components

The current CERIF 2008 – 1.1 release comprises the following components:

- CERIF 2008 1.1 FDM: Model Introduction and Specification separate document available from the euroCRIS website [2]
- CERIF 2008 1.1 XML: Data Exchange Format Specification separate document available from the euroCRIS website [3]
- CERIF 2008 1.1 Semantics *this document*
- CERIF 2008 1.1 FDM: SQL scripts for most common databases *available from the euroCRIS website for members only*
- CERIF 2008 1.1 XML Examples *available from the euroCRIS website for members only*
- CERIF 2008 1.1 XML Schema Files CERIF XML validation files available from the euroCRIS website

CERIF 2008 – 1.1 related files and more documents and background information about CERIF and CRISs can be downloaded from the public euroCRIS website: <u>http://www.eurocris.org/cerif/cerif-releases/cerif-2008/</u>. The physical SQL scripts and XML examples files are available for members only^{*}.

^{*} The CERIF 2008 – 1.1 release was modeled with Toad Data Modeler³ by Quest Software³ which allows to draw ERM diagrams, to generate SQL scripts for most common databases (Oracle, Microsoft, IBM, etc.), to reverse engineer from databases, to create screenshots of the model and model parts, and to model at physical and logical level. The resulting CERIF SQL scripts are generated automatically from the physical level.

3. CERIF Semantics 2008 – 1.1

The CERIF Semantics is maintained within the so called Semantic Layer that has been thoroughly introduced as a concept – enhanced with examples, as part of the CERIF 2008 - 1.1 Introduction and Specification document [2]. The CERIF Semantics may be best viewed as a filler; stuffing the CERIF Semantic Layer with contextually relevant semantics. We present the current CERIF Semantics for the publication entity; that is: types of publication documents, and roles for the linkage between the entities involved.

4. Next Steps

The extension of the CERIF Semantics is a major focus alongside upcoming CERIF releases. This current version of a publication-related semantics has only been a first step into this direction, where in the very next future, we will concentrate on the recommendation of a CORE CERIF including semantics, in parallel to the development of a formal CERIF ontology representing the CORE CERIF Semantics.
