Messaging Service Specification

ebXML Transport, Routing & Packaging

Version 0.21d

16 October 2000

25 **1 Status of this Document**

26

27 This document specifies an ebXML DRAFT for the eBusiness community.

28

29 Distribution of this document is unlimited.

30

31 The document formatting is based on the Internet Society's Standard RFC format converted to
32 Microsoft Word 2000 format.

33

34 ***This version:***35 http://www.ebxml.org/working/project_teams/...

36

37 ***Latest version:***38 <http://www.ebxml.org/...>

176 4 Introduction

177 4.1 Summary of Contents of Document

178 This specification defines the ebXML Messaging Service protocol which enables the secure and
179 reliable exchange of messages between two parties. It includes descriptions of:

- 180
- 181 • the *ebXML Message* structure used to package ebXML Messages for transport between
182 parties, and
- 183
- 184 • the behavior of the messaging service that sends or receives those messages.
- 185

186 No assumption or dependency is made relative to communication protocol or type of payload.
187 The specifications contained here are both payload and communication protocol neutral.

188

189 Terms in *Italics* are defined in the ebXML Glossary of Terms [Glossary]. Terms listed in **Bold**
190 **Italics** represent the element and/or attribute content of the XML *ebXML Message Header*.
191 Terms listed in *Courier* font relate to MIME components.

192

193 The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT,
194 RECOMMENDED, MAY, and OPTIONAL, when they appear in this document, are to be
195 interpreted as described in RFC 2119 [Bra97].

196

197 Note that the force of these words is modified by the requirement level of the document in which
198 they are used.

199

200 MUST: This word, or the terms "REQUIRED" or "SHALL", means that the definition is an
201 absolute requirement of the specification.

202

203 MUST NOT: This phrase, or the phrase "SHALL NOT", means that the definition is an
204 absolute prohibition of the specification.

205

206 SHOULD: This word, or the adjective "RECOMMENDED", means that there may exist
207 valid reasons in particular circumstances to ignore a particular item, but the full
208 implications must be understood and carefully weighed before choosing a different
209 course.

210

211 SHOULD NOT: This phrase, or the phrase "NOT RECOMMENDED", means that there
212 may exist valid reasons in particular circumstances when the particular behavior is
213 acceptable or even useful, but the full implications should be understood and the case
214 carefully weighed before implementing any behavior described with this label.

216 4.2 Audience

217 The target audience for this specification is the community of software developers who will
218 implement the ebXML Messaging Service.

219 4.3 Related Documents

220 The following set of related specifications will be delivered in phases:

- 221 • **ebXML Messaging Service Specification** (this document) - defines the structure of the
222 messages and the behavior of messaging services software. This will include:

- 223 - definitions of the messages
- 224 - behavior of the messaging service software
- 225 - reliable messaging
- 226 - message security
- 227 - extensibility and versioning
- 228 • **ebXML Trading Partner Specification** (under development) - defines how one party can
- 229 discover and/or agree upon the information that party needs to know about another party
- 230 prior to sending them a message that complies with this specification
- 231 • **ebXML Messaging Service Interface Specification** (to be developed) - defines an
- 232 interface that may be used by software to interact with an ebXML Messaging Service
- 233 • **ebXML Messaging Services Security Specification** (under development) – defines the
- 234 security mechanisms necessary to negate anticipated, selected threats
- 235 • **ebXML Messaging Services Requirements Specification** – defines the requirements
- 236 of the Messaging Services

237 5 Design Objectives

238 5.1 Goals/Objectives/Requirements/Problem Description

239 The design objectives and goals are to define a Messaging Service (MS) to support XML based
240 electronic business between small, medium and large enterprises. This specification is intended
241 to enable a low cost solution, while preserving a vendor's ability to add unique value through
242 added robustness and superior performance. It is the intention of the Transport, Routing and
243 Packaging Project Team to keep this specification as simple and succinct as possible. Every item
244 in this specification is being prototyped by the ebXML Proof of Concept Team in order to ensure
245 the clarity and succinctness of this specification. This specification is organized around the
246 following topics:

- 247 • **Packaging Specification** - A description of how to package an *ebXML Message* and
- 248 associated parts. This section includes specifications for the various structures and
- 249 containers. The Packaging Specification is a standard MIME multipart/related structure
- 250 with two parts: XML Message Headers and Payload. The payload may be any type of
- 251 data that MIME RFC 2045 and related IETF MIME extensions may support. The XML
- 252 based Message Header elements and their structure were chosen after reviewing several
- 253 current transports, both proprietary and non-proprietary, to ensure that the appropriate
- 254 header elements were included in the specification
- 255 • **Message Headers** - A specification of the structure and composition of the information
- 256 necessary for an ebXML Messaging Service to successfully generate or process an
- 257 ebXML compliant message.
- 258 • **Reliable Messaging** - The Reliable Messaging function defines an interoperable protocol
- 259 such that any two Messaging Service implementations can “reliably” exchange messages
- 260 that are sent using “reliable messaging” semantics. Please see Section 7.11.
- 261 • **Error Handling** - This section describes how one ebXML Messaging Service reports
- 262 errors it detects to another ebXML Messaging Service.
- 263 • **Security** - This version of the specification supports limited security services that is those
- 264 security services that can be supported within the payload. The `multipart/related`
- 265 payload may be encrypted using cryptographic techniques suitable for the payload type.
- 266

267 Appendices to this specification cover the following:

268

- 269 • Appendix A Schemas and DTD Definitions
- 270 • Appendix B Examples
- 271 • Appendix C Candidate Packaging Technologies and Selection Process
- 272 • Appendix D MIME Type discussion
- 273 • Appendix E Communication Protocol Envelope Mappings
- 274 • Appendix F Detailed list of the Messaging Services Requirement Phases

275 5.2 Caveats and Assumptions

276 The specification is the first in a series of phased deliverables. This version of the specification
277 does not address complete message security, extensibility, service interface, reliability, and
278 versioning. These are being developed as separate documents and will be included in later
279 versions of this document or as additional service specifications to the ebXML Message Services
280 Specification.

281

282 It is assumed that the reader has an understanding of transports, MIME and XML.

283 6 System Overview

284 This document defines the enveloping and *ebXML Message* header structure used to transfer
285 *ebXML Messages* over a data communication mechanism. This document provides sufficient
286 detail to develop software for the packaging, exchange and processing of *ebXML Messages*.

287 6.1 What ebXML Messaging Services does

288 ebXML Messaging Services (MS) defines, robust yet basic functionality necessary to transfer
289 messages between two ebXML Message Services using various existing communication
290 protocols. The ebXML Messaging Service will perform in a manner which will allow for reliability,
291 persistence of messages, security, and extensibility.

292 6.2 Where ebXML Messaging Services May Be Implemented

293 The ebXML Messaging Services is expected to be implemented in environments requiring a
294 robust, low cost solution to enable electronic business.

295 7 Definition and Scope

296 7.1 Packaging Specification

297 7.1.1 ebXML Message Structure

298 An *ebXML Message* consists of:

- 299 • an outer Communication Protocol Envelope, such as HTTP or SMTP,
- 300 • an inner communication "protocol independent" *ebXML Message Envelope*, specified
301 using MIME multipart/related, that contains the two main parts of the Message:
 - 302 - an ebXML Header Container that is used to envelope one ebXML Header Document, and
 - 303 - an optional, single *ebXML Payload Container* that MUST be used to envelope the actual
304 payload (transferred data) of the Message

Note: The Courier font is used to represent MIME components. Items shown in **bold italics** represent XML items.

 325

7.1.2 ebXML Header Envelope and Payload Envelope

An *ebXML Header Envelope* and an *ebXML Payload Envelope* are constructed of standard, MIME components.

An *ebXML Header (or Payload) Document* is the content of the standard MIME part and is:

- an XML document in an **ebXML Header**, or
- an XML or some other document for the ebXML Payload

Any special considerations for the usage the *ebXML Message Envelope* in TCP/IP, HTTP and SMTP transports are described in Appendix E.

7.1.3 MIME usage Conventions

Values associated with MIME header attributes are valid in both quoted and unquoted form. For example, the forms `type="ebxml"` and `type=ebxml` are both valid.

326 7.2 ebXML Message Envelope

327 The MIME structured *ebXML Message Envelope* is used to identify the message as an ebXML
328 compliant structure and encapsulates the header and payload in MIME body parts. It MUST
329 conform to [RFC2045] and MUST contain two MIME headers:

- 330 • Content-Type
- 331 • Content-Length

332

333 7.2.1 Content-Type

334 The MIME Content-Type MUST be set to `multipart/related` for all *ebXML Message*
335 *Envelopes*. See Appendix C for selection rationale. For example:

```
336 Content-Type: multipart/related;
```

337

338 The MIME Content-Type header contains three attributes:

- 339 • type
- 340 • boundary
- 341 • version

342 7.2.1.1 type Attribute

343 The MIME `type` attribute is used to identify the *ebXML Message Envelope* as an ebXML
344 compliant structure. It conforms to a MIME XML Media Type [XMLMedia] and MUST be set to
345 "`application/vnd.eb+xml`". For example:

```
346 type="application/vnd.eb+xml"
```

347 7.2.1.2 boundary Attribute

348 The MIME `boundary` attribute is used to identify the body part separator used to identify the start
349 and end points of each body part contained in the message. The MIME `boundary` SHOULD be
350 chosen carefully in order to ensure that it does not occur within the content area of a body part
351 see [RFC 2045] for guidance on how to do this. For example:

```
352 boundary:="-----8760"
```

353 7.2.1.3 version Attribute

354 The MIME `version` attribute is used to identify the particular version of *ebXML Message*
355 *Envelope* being used. All message headers SHOULD USE "1.0". For example:

```
356 version="1.0"
```

357 7.2.2 Content-Length

358 The MIME Content-Length header is a decimal value used to identify the total number of
359 OCTETS contained in all constituent message body parts, including body part boundaries.

360

361 The value of the Content-Length MIME header is computed by counting the total number of
362 OCTETS starting with the first OCTET after the CRLF following the first MIME header and ending
363 with the OCTET immediately before the MIME object's last boundary string.

364

365 Example:

366 `Content-Length: 9841`

367 **7.2.3 ebXML Message Envelope Example**

368 An example of a compliant *ebXML Message Envelope* header appears as follows:

369 `Content-Type: multipart/related; type="application/vnd.eb+xml" "boundary:="-----8760"`
 370 `charset="iso-8859-1" Content-Length: 9841`

371 **7.3 ebXML Header Container**

372 The *ebXML Header Container* is a MIME body part that MUST consist of:

- 373 • one XML based ebXML Header Envelope, and
- 374 • one XML **ebXML Header Document** (described in section 8 of this document)

375

376 The following rules apply:

- 377 • the *ebXML Header Container* MUST be the first MIME body part in the *ebXML Message*.
- 378 • there MUST be one and only one *XML ebXML Header Document* in each *ebXML*
- 379 *Message*. However, an *ebXML Payload Container* may be a completely encapsulated
- 380 *ebXML Message*.

381

382 The MIME based *ebXML Header Envelope* conforms to [RFC 2045] and MUST consist of three

383 MIME headers:

- 384 • `Content-ID`
- 385 • `Content-Length`
- 386 • `Content-Type`

387

388 The *ebXML Header Document* within the content portion of the MIME container MAY be

389 enhanced during transport, provided it has not been digitally signed. Any change in the size of the

390 *ebXML Header Document* MUST be reflected in `Content-Length` attribute of the *ebXML*

391 *Message Envelope* and *ebXML Header Envelope*.

392 **7.3.1 Content-ID**

393 The `Content-ID` MIME header identifies this instance of an ebXML Message header body part.

394 The value for `Content-ID` SHOULD be a unique identifier, in accordance with RFC 2045. For

395 example:

396 `Content-ID: <2000-0722-161201-123456789@ebxmlhost.realm>`

397 **7.3.2 Content-Length**

398 The MIME `Content-Length` header is a decimal value used to identify the total number of

399 OCTETS contained in the *ebXML Header Container* MIME body part. For example:

400 `Content-Length: 4208`

401 **7.3.3 Content-Type**

402 The MIME `Content-Type` for an ebXML header is identified with the value

403 "application/vnd.eb+xml". `Content-Type` MUST contain two attributes:

- 404 • `version`, and
- 405 • `charset`

406 **7.3.3.1 version Attribute**

- 407 • The MIME `version` attribute indicates the version of the ebXML Messaging Service
408 Specification to which the *ebXML Header Document* conforms. For example:

```
409 version="1.0";
```

410 **7.3.3.2 charset Attribute**

411 The MIME `charset` attribute identifies the character set used to create the ebXML Header
412 Document. The list of valid values can be found at <http://www.iana.org/>.

413
414 The MIME `charset` attribute SHALL be equivalent to the encoding attribute of the *ebXML
415 Header Document* (see section 7.6). For maximum interoperability it is RECOMMENDED that
416 [UTF-8] be used. Note: this is not the default for MIME. For example:

```
417 charset="UTF-8"
```

419 **7.3.4 ebXML Header Envelope Example**

420 The following represents an example of an *ebXML Header Envelope* and *ebXML Header
421 Document*:

422	Content-ID: ebxmlheader-123@ebxmlhost.realm --		
423	Content-Length: 2048	MIME ebXML	
424	Content-Type: application/vnd.eb+xml;	Header Envelope	
425	version="1.0"; charset="UTF-8" --		ebXML
426			Header
427	<ebXMLHeader> -----		Container
428	<Manifest>.....	XML ebXML Header	
429	</Manifest>	Document	
430	<Header>.....		
431	</Header>		
432	<Routing Header>.....		
433	</Routing Header>		
434	</ebXMLHeader> -----		

435 A complete example of an *ebXML Header Container* is presented in Appendix B.

436 **7.4 ebXML Payload Container**

437 If the *ebXML Message* contains a payload, then a single *ebXML Payload Container* MUST be
438 used to envelop it.

439
440 If there is no payload within the *ebXML Message* then the *ebXML Payload Container* MUST not
441 be present.

442
443 The contents of the *ebXML Payload Container* MUST be identified by the *Message Manifest*
444 element within the *ebXML Header Document* (see section 7.8).

445
446 If the *Message Manifest* is an empty XML element, the *ebXML Payload Container* MUST NOT be
447 present in the *ebXML Message*.

448
449 If an *ebXML Payload Container* is present, it MUST conform to MIME [RFC2045] and MUST
450 consist of:

- 451 • a MIME header portion - the *ebXML Payload Envelope*, and
- 452 • a content portion - the payload itself which may be of any valid MIME type.

453 The *ebXML MIME Payload Envelope*, MUST consist of three MIME headers:

- 455 • Content-ID
- 456 • Content-Length
- 457 • Content-Type

458
 459 The ebXML Messaging Service Specification makes no provision, nor limits in any way the
 460 structure or content of payloads. Payloads MAY be a simple-plain-text-object or complex nested
 461 multipart objects. This is the implementer's decision.

462 **7.4.1 Content-ID**

463 The Content-ID MIME Header is used to uniquely identify an instance of an *ebXML Message*
 464 payload body part. The value for Content-ID SHOULD be a unique identifier, in accordance
 465 with MIME [RFC 2045]. For example:

```
466 Content-ID: <2000-0722-161201-123456789@ebxmlhost.realm>
```

467 **7.4.2 Content-Length**

468 The MIME Content-Length header is a decimal value used to identify the total number of
 469 OCTETS contained in the content portion of the *ebXML Payload Container*. For example:

```
470 Content-Length: 5012
```

471 **7.4.3 Content-Type**

472 The MIME Content-Type for an ebXML payload is determined by the implementer and is used
 473 to identify the type of data contained in the content portion of the *ebXML Payload Container*. The
 474 MIME Content-Type must conform to [RFC2045]. For example:

```
475 Content-Type: application/xml
```

476 **7.4.4 Example of an ebXML MIME Payload Container**

477 The following represents an example of an *ebXML MIME Payload Envelope* and a payload:

```
478 Content-ID: ebxmlpayload-123@ebxmlhost.realm --| |
479 Content-Length: 4096 | ebXML MIME |
480 Content-Type: application/xml -----| Payload Envelope | ebXML
481 | | | Payload
482 <Invoice> -----| | Container
483 <Invoicedata>..... | Payload |
484 </Invoicedata> | |
485 </Invoice> -----| |
```

486
 487 A complete example of the ebXML Payload Container is presented in Appendix B.

490 **7.5 ebXML Header Document**

491 The ebXML Header Document is a single [XML] document with a number of principal header-
 492 elements. In general, separate principal-header elements are used where:

- 493 • different software is likely to be used to generate that header-element,
- 494 • the structure of the header element might vary independently of the other header-
- 495 elements, or
- 496 • the data contained in the header-element MAY need to be digitally signed separately
- 497 from the other header-elements.
- 498

499 7.6 XML Prolog

500
501 The XML prolog for the *ebXML Header Document* SHALL contain the encoding attribute which
502 SHALL be equivalent to the `charset` attribute of the MIME `Content-Type` of the ebXML
503 Message Header Container (see section 7.3.3.2). It is RECOMMENDED that UTF-8 be used
504 explicitly although this is one of the default values assumed if none is specified.

505
506 NOTE: The encoding attribute is OPTIONAL in the XML version 1.0 specification [XML], however,
507 it is mandatory for the ebXML message header to ensure no conflicts occur with the `charset`
508 attribute of the MIME `Content-Type` of the container and to ensure maximum interoperability. For
509 example:

```
510 <?xml version="1.0" encoding="UTF-8"?>  
511
```

512 7.7 ebXMLHeader Element

513 The root element of the *XML ebXML Header Document* is named **ebXMLHeader**. It is comprised
514 of three XML attributes and two subordinate elements.
515

516 7.7.1 ebXMLHeader attributes

517
518 There are three attributes associated with the **ebXMLHeader**, which are:

- 519 • Namespace (`xmlns`)
 - 520 • Version
 - 521 • MessageType
- 522

523 7.7.1.1 Namespace

524 The namespace declaration (`xmlns`) (see [XML Namespace]) has a REQUIRED value of
525 "`http://www.ebxml.org/namespaces/messageHeader`".
526

527 7.7.1.2 Version

528 The **Version** attribute is required. Its purpose is to provide for future versioning capabilities. It has
529 a default value of '1.0'.
530

531 7.7.1.3 MessageType

532 The purpose of the **MessageType** attribute is to enable ebXML-aware software to distinguish
533 between normal and communication protocol-specific messages, such as acknowledgment and
534 error messages. The **MessageType** is an enumeration consisting of three possible values:

- 535 • **Normal** – the ebXML Payload Container contains data that has been provided to the
536 ebXML Messaging Service by the software that called it
- 537 • **Acknowledgment** – a ebXML Messaging Service-specific acknowledgment message.

- 538 • **Error** – an ebXML Messaging Service-specific error message.
539

540 7.7.2 ebXMLHeader elements

541 The **ebXMLHeader** element MUST contain the following two elements:

- 542 • Manifest
543 • Header
544

545 7.7.2.1 Manifest

546 The **Manifest** is a REQUIRED element that contains a list of references to the other parts of the
547 Message. This includes references to the documents, which comprise the *Payload* of the
548 Message.

549 7.7.2.2 Header

550 The **Header** is a REQUIRED element that contains the information REQUIRED by the recipient to
551 process the message. The message originator creates this information to which additional
552 information MAY be added.
553

554 7.7.3 ebXMLHeader sample

555 The following is a sample **ebXMLHeader** document fragment demonstrating the overall structure:

```
556 <?xml version="1.0" encoding="UTF-8"?>  
557 <ebXMLHeader xmlns="http://www.ebxml.org/namespaces/messageHeader"  
558       Version="1.0" MessageType="Normal">  
559     <Manifest>...</Manifest>  
560     <Header>...</Header>  
561 </ebXMLHeader>
```

562 7.8 XML Manifest

563 The required **Manifest** element is a composite element consisting of zero or more
564 **DocumentReference** elements. Each **DocumentReference** element identifies data associated
565 with the message, whether included as part of the message, or remote resources accessible via a
566 URL. The **Manifest** SHALL be the first subordinate element in the **ebXMLHeader**. It identifies
567 the payload document(s) contained in the *ebXML Message Container*. The purpose of the
568 **Manifest** is to make it easier to directly extract a particular document associated with the
569 Message.

570 7.8.1 XML DocumentReference

571 The **DocumentReference** element is a composite element consisting of three subordinate
572 elements as follows:

- 573 • **DocumentDescription**
574 • **DocumentLabel**
575 • **DocumentId**
576

577 7.8.1.1 DocumentDescription

578 The **DocumentDescription** is an OPTIONAL textual description of the document/resource.
579

580 **7.8.1.2 DocumentLabel**

581 The **DocumentLabel** is a code that enables the purpose of the referenced document to be
 582 determined without retrieving the referenced document.
 583

584 **7.8.1.3 DocumentId**

585 The **DocumentId** is the URL of the `Content-ID` of a MIME body part, as defined in [RFC2392],
 586 representing payload data, or a remote URL to some external resource.
 587

588 **7.8.2 Manifest sample**

589 The following fragment demonstrates a typical **Manifest** for a message with a single payload
 590 MIME body part:

```
591 <Manifest>
592   <DocumentReference>
593     <DocumentLabel>PurchaseOrder</DocumentLabel>
594     <DocumentId>cid:0987654321</DocumentId>
595   </DocumentReference>
596 </Manifest>
```

597 **7.9 XML Header**

598 The **Header** element immediately follows the **Manifest** element. It is required in all
 599 **ebXMLHeader** documents. The **Header** element is a composite element comprised of the
 600 following required subordinate elements:

- 601 • **From**
- 602 • **To**
- 603 • **TPAInfo**
- 604 • **MessageData**
- 605 • **ReliableMessagingInfo**

606

607 **7.9.1 From and To**

608 The **From** element identifies the **Party** which originated the message. It is a logical identifier,
 609 which MAY take the form of a URN. An example of this would be a DUNS number. The **From**
 610 element consists of a **PartyId** element.

611

612 The **To** element identifies the intended recipient of the message. As with **From**, it is a logical
 613 identifier which is comprised of a **PartyId** element.

614

615 The **PartyId** element has a single attribute; **context** and a text value. The purpose of the context
 616 attribute is to provide a context for the text value of the **PartyId** element. The following fragment
 617 demonstrates usage of the **From** and **To** elements of the **ebXMLHeader**.

```
618 <From>
619   <PartyId context="DUNS">1234567890123</PartyId>
620 </From>
621 <To>
622   <PartyId context="DUNS">3210987654321</PartyId>
```

623 </To>

624 7.9.2 TPAInfo

625 The **TPAInfo** element follows the **From** and **To** elements in the **Header** element structure. The
 626 **TPAInfo** element is a composite set of information that relates to the *Trading Partner Agreement*
 627 under which the message is governed. The **TPAInfo** element has four subordinate elements as
 628 follows:

- 629 • **TPAId**
- 630 • **ConversationId**
- 631 • **ServiceInterface**
- 632 • **Action**

633 7.9.2.1 TPAId

634 The **TPAId** is a URI which identifies the *Trading Partner Agreement* which governs the
 635 processing of the message.

636 7.9.2.2 ConversationId

637 The **ConversationId** is a URI which identifies the set of related messages that make up a
 638 conversation between two **Parties**.

639 7.9.2.3 ServiceInterface

640 The **ServiceInterface** identifies the Service Interface that SHOULD act on the payload in the
 641 message. It is unique within the domain of the **Party** to which the message is being sent. UNR's
 642 MAY be considered suitable for the element content.

643 7.9.2.4 Action

644 The **Action** identifies a process within a Service Interface, which processes the Message.
 645 **Action** SHALL be unique within the Service Interface in which it is defined.

646 7.9.2.5 TPAInfo sample

647 The following example fragment demonstrates the usage of the **TPAInfo** element.

```
648 <TPAInfo>
649     <TPAId context = "tpadb">12345678</TPAId>
650     <ConversationId>987654321</ConversationId>
651     <ServiceInterface>QuoteToCollect</ServiceInterface>
652     <Action>NewPurchaseOrder</Action>
653 </TPAInfo>
```

654 7.9.3 MessageData

655 The required **MessageData** element follows the **TPAInfo** element. The purpose of the
 656 **MessageData** element is to provide a means of identifying an *ebXML Message*. It is a composite
 657 element that contains the following three elements:

- 658 • **MessageID**
- 659 • **TimeStamp**
- 660 • **RefToMessageID**

661 7.9.3.1 MessageId

662 The **MessageId** is a unique identifier for the message conforming to [RFC2392]. The "local part"
 663 of the identifier is implementation dependent.

664 7.9.3.2 TimeStamp

665 The **TimeStamp** is a value representing the time that the message header was created
 666 conforming to [ISO-8601]. The format of CCYYMMDDTHHMMSS.SSSZ is used. This time
 667 format is Coordinated Universal Time (UTC).

668 7.9.3.3 RefToMessageId

669 For **Normal** and **Error** Messages, the **RefToMessageId** is an optional reference to an earlier
 670 ebXML Message. If there is no earlier message, the element MUST be empty. If element is not
 671 empty then it MUST contain the value of the **MessageId** of the earlier related ebXML Message.
 672

673 For **Acknowledgment** Messages, the **RefToMessageId** reference is mandatory, and its value
 674 MUST be the **MessageId** of the ebXML Message being acknowledged.

675 7.9.3.4 MessageId sample

676 The following example demonstrates the usage of the **MessageData** element.

```
677 <MessageData>
678   <MessageId>UUID-2</MessageId>
679   <TimeStamp>20000725T121905.000Z</TimeStamp>
680   <RefToMessageId>UUID-1</RefToMessageId>
681 </MessageData>
```

682 7.9.4 ReliableMessagingInfo

683 The last element of the **ebXMLHeader** is the **ReliableMessagingInfo** element. This element
 684 identifies the degree of reliability with which the message will be delivered. This element has a
 685 single attribute, **DeliverySemantics**. This attribute is an enumeration, which may have one of the
 686 following values:
 687

- 688 • "OnceAndOnlyOnce" – reliable messaging semantics: the receiving Service Interface
 689 handler will receive a given message no more than once, the sending Messaging Service
 690 will execute retry procedures in the event of failure and the sending Service Interface
 691 handler will be notified in the event of failure.
- 692 • "BestEffort" – reliable delivery semantics are not specified: the Sending Service Interface
 693 handler is not notified of failure to deliver the message, duplicate messages might be
 694 delivered and persistent storages are not required.

```
695 <ReliableMessagingInfo DeliverySemantics="OnceAndOnlyOnce">
696 </ReliableMessagingInfo>
```

697

698 7.9.5 XML Header sample

699 The following fragment demonstrates the structure of the **Header** element of the **ebXMLHeader**
 700 document:
 701

```
702 <Header>
703   <From>...</From>
704   <To>...</To>
705   <TPAInfo>...</TPAInfo>
706   <MessageData>...</MessageData>
707   <ReliableMessagingInfo>...</ReliableMessagingInfo>
```

708 `</Header>`

7.10 XML Routing Header

710 One **RoutingHeader** element immediately follows the **Header** element. It is required in all
 711 **ebXMLHeader** documents. The **RoutingHeader** element is a composite element comprised of at
 712 least the following four required subordinate elements:

- 713 • **SenderURI** – the Sender’s Messaging Service Handler URI.
- 714 • **ReceiverURI** – the Receiver’s Messaging Service Handler URI.
- 715 • **ErrorURI** – URI designated by the Sender for reporting errors.
- 716 • **Timestamp** – timestamp of the **RoutingHeader** creation, in the same format used for
 717 **Timestamp** in the **XML Header MessageData** element.

718 When the **RoutingHeader** is used for a message sent with Reliable Messaging functions
 719 (**DeliverySemantics** is set to “OnceAndOnlyOnce” in the **XML Header ReliableMessagingInfo**
 720 element), the Sender SHALL add one additional **RoutingHeader** element to the **RoutingHeader**.
 721

- 722 • **SequenceNumber** – Integer value that is incremented (e.g. 1, 2, 3, 4...) for each Sender-
 723 prepared message sent to the Receiver. The Sequence Number consists of ASCII
 724 numerals in the range 1-999,999,999. In following cases, the Sequence Number takes
 725 the value “1”:
- 726 - First message from the Sender to a particular Receiver
- 727 - First message after wraparound (next value after 999,999,999)
- 728 - First message after removing Sequence Number information in the Sender (Sender MAY
 729 remove Sequence Number information when it has no messages which were sent to
 730 the Receiver for long time).

731 The following fragment demonstrates the structure of the **RoutingHeader** element of the
 732 **ebXMLHeader** document when Reliable Messaging is used:
 733

```

734 <RoutingHeader>
735   <SenderURI>...</SenderURI>
736   <ReceiverURI>...</ReceiverURI>
737   <ErrorURI>...</ErrorURI>
738   <Timestamp>...</Timestamp>
739   <SequenceNumber>...</SequenceNumber>
740 </RoutingHeader>
    
```

7.11 Reliable Messaging Flow

742 The Reliable Messaging function defines an interoperable protocol such that any two Messaging
 743 Service implementations can “reliably” exchange messages that are sent using “reliable
 744 messaging” semantics.

745 Reliably exchanging messages means that, with respect to Sending and Receiving Message
 746 Service implementations:

- 748 • For any given message provided to the Sending Messaging Service, the Receiving
 749 Messaging Service will deliver at most one copy of the message to the Receiver.

- 750 • A positive acknowledgement will be sent from the Receiving Messaging Service to the
- 751 Sending Messaging Service to indicate receipt and storage in persistent storage, and if this
- 752 acknowledgement is not received the Sending Messaging Service will notify the original
- 753 Sending Party
- 754 • Both the Sending and Receiving Messaging Services will use persistent storage for recovery

755
756
757
758
759

Reliable Messaging is defined only for direct connections between Messaging Service implementations. At a later time, networks consisting of intermediate Messaging Service implementations will be supported.

760 All ebXML Messaging Service implementations SHALL support the Reliable Messaging function.
761 With respect to a particular Sender and Receiver pair, transmission of one reliable message
762 SHALL be completed before another reliable message may be sent.

763
764

The following figure shows the reliable messaging flow:

765
766

Figure 7-2: Reliable Message Transfer Sequence

767 Reliable Messaging processing is shown in the following sequence:

768
769

(1) Message preparation

770
771
772
773

Sender initially stores messages passed from the ebXML "From-Party" in persistent storage, and then prepare the stored message for message transfer.

774
775

(2) Sending message

776
777
778

A Reliable Message has **DeliverySemantics** = "OnceAndOnlyOnce", and receipt of a message with this value notifies the Receiver of Reliable Messaging semantics.

779
780

(3) Receiving, checking and storing message

781
782
783

The Receiver receives the reliable message and, if the message is not a duplicate message, stores the message in persistent storage and processes the message appropriately.

784

(4) Acknowledgment by Receiver

785
 786 The Receiver returns an Acknowledgment Message to the Sender for every received reliable
 787 message, even if it is a duplicate message.

788
 789 (5) Sender checks the acknowledgement and removes transferred message

790
 791 Sender checks the Acknowledgement Message from the Receiver. If the reply is an
 792 appropriate Acknowledgement Message for the transferred message, Sender may remove
 793 the transferred message from Sender's persistent storage if the message is no longer
 794 needed for some other Messaging Service function or later failure recovery.

795
 796 The Receiver's Messaging Service sends an Acknowledgement Message to the Sender's
 797 Messaging Service for every Normal Reliable Messaging message received. There is no reply to
 798 the Acknowledgement message from the Sender's Messaging.

799
 800 In the Acknowledgement Message:

- 801 • The **MessageType** SHALL be "Acknowledgement"
- 802 • There is no Payload and no business level response information.
- 803 • **From** SHALL be the **ReceiverURI** as shown in the Routing Header Document
- 804 • **To** SHALL be the **SenderURI** as shown in the Routing Header Document
- 805 • **TPAId** and **ConversationID** as shown in the Header Document
- 806 • **ServiceInterface** and **Action** SHALL be empty
- 807 • **RefToMessageId** SHALL be the **MessageId** of the reliable message
- 808 • **DeliverySemantics** SHALL be "BestEffort"

809 **7.12 Reliable Messaging Recovery Procedures**

810 **7.12.1 Messaging Service Parameters**

811
 812 In Reliable Messaging, the sending messaging service uses the following Messaging Service
 813 parameters during recovery procedures.

814
 815 This information may be determined in a number of ways, such as the TPA or some other
 816 method.

817 **Table 7-2 Messaging Service Parameters used in Recovery**

Argument	Outline Description
Timeout	Wait time for any response from the Receiver. <ul style="list-style-type: none"> • Integer value specifying a number of seconds • After sending a Normal Message, the Sender SHALL wait for any response (MS Acknowledgement or Error Message) for the specified time before start of retry
Retries	Maximum number of retries. <ul style="list-style-type: none"> • Integer value specifying the number of retries • The Sender SHALL repeat retries the specified number of times until the Sender receives an MS Acknowledgement Message • If the Sender does not receive an MS Acknowledgement Message after the maximum number of retries, the Sender SHALL notify the incident to the higher level (application and/or system admin)

<i>RetryInterval</i>	Wait time between retries, if an Acknowledgement Message is not received <ul style="list-style-type: none"> • Integer value specifying a number of seconds • After a retry, the Sender SHALL wait for a response (MS Acknowledgement or Error Message) for specified time before start of the next retry
-----------------------------	--

818 **7.12.2 Recovery Sequence for Lost Messages**

819

820 When the Sender detects a timeout while waiting for an Acknowledgement Message from the last
 821 sent message, the appropriate recovery handler in the Sender executes a Messaging Service
 822 recovery sequence.

823

824 The timeout value period is defined as **Timeout**. The recovery sequence SHALL re-send the final
 825 message to the Receiver and SHALL use a retry interval, **RetryInterval**, between attempts The
 826 retry sequence SHALL be attempted a **Retries** number of times.

827

828 The content of the re-sent message is exactly the same as the original message. In the recovery
 829 sequence or after the recovery sequence,

830

- 831 • If the Sender does not receive any error message or Acknowledgment Message in the
 832 retry interval, the recovery handler repeats the recovery sequence the **Retries** number
 833 of times.
- 834
- 835 • If the Sender detects or receives another Error Message, the recovery handler executes
 836 the appropriate recovery sequence for the error.
- 837
- 838 • If the Sender receives an Acknowledgment Message during the recovery sequence, the
 839 message transmission is completed.

840

841

Figure 7-3 Recovery Sequence for Timeout

842

843

7.12.3 Maximum Number of Retries and Retry Interval

844 The retry interval is defined as **RetryInterval**. When the total number of retries in a reliable
 845 message transmission reaches a maximum number, defined as **Retries**, and the last error is still
 846 not resolved, the recovery handler will:

- 847
- 848 (1) Suspend sending messages to the Receiver
- 849
- 850 (2) Report this incident to a higher-level so that a system administrator can resolve this incident
- 851

852 When the system administrator resolves the incident, the recovery handler will reset the retry
 853 counter to zero and then re-start message transfer sequence from the uncompleted reliable
 854 message transmission.

855

856 **Figure 7-4 Repeat of Recovery Sequence (maximum number of retries specified is 3)**

857

858 7.13 ebXML Error Reporting

859 This section describes how one ebXML Messaging Service reports errors it detects to another
860 ebXML Messaging Service.

861 7.13.1 Definitions

862 For clarity two phrases are defined which are used in this section:

- 863 • *message in error*. A message which contains or causes an error of some kind
- 864 • *message reporting the error*. A message that contains an ebXML Error Document that
865 describes the error(s) found in a *message in error*.

866 7.13.2 Types of Errors

867 One ebXML Messaging Service needs to report to another ebXML Messaging Service errors in
868 *message in error* that are associated with:

- 869 • the structure or content of the *Message Envelope* (e.g. MIME),
- 870 • the ebXML Message Header document,
- 871 • security, or
- 872 • reliable messaging failures.

873

874 Unless specified to the contrary, all references to "an error" in the remainder of this specification
875 imply any of the types of errors described above.

876

877 Errors associated with Data Communication protocols are detected and managed in an
878 implementation specific way and are not part of this error reporting mechanism

879 7.13.3 When to generate Error Messages

880 When an ebXML Messaging Service detects an error in a *message in error*, a *message reporting*
881 *the error* MUST be generated and delivered to the ebXML Messaging Service which sent the
882 *message in error* for a normal ebXML message if:

- 883 • the Error Reporting Location (see section 7.13.4) to which the *message reporting the*
884 *error* should be sent can be determined, and
- 885 • the message in error does not have a **MessageType** of **Error**.

886

887 If the Error Reporting Location cannot be found or the *message in error* has a **MessageType** of
888 **Error**, it is recommended that:

- 889 • the error is logged,
- 890 • the problem is resolved by other means, and
- 891 • no further action is taken.

892 7.13.4 Identifying the Error Reporting Location

893 The Error Reporting Location is a URI that is specified by the sender of the *message in error* that
894 indicates where to send a *message reporting the error*. This may be specified:

- 895 • by reference, for example by using the **TPAId** to identify the Party Agreement which
896 contains the Error Reporting Location, or
- 897 • by value, for example by using the **ErrorURI** contained within the Routing Header
898 element.

899 If a *message* contains both an **ErrorURI** and other means of identifying the Error Reporting
 900 Location then the **ErrorURI** MUST be used.

901
 902 If an **ErrorURI** is not used then the method used to determine the Error Reporting Location is
 903 outside of the scope of this version of the specification.

904
 905 Even if the *message in error* cannot be successfully analyzed or parsed, ebXML Messaging
 906 Service implementers SHOULD try to determine the Error Reporting Location by other means.
 907 How this is done is an implementation decision.

908 **7.13.5 ebXML Error Message**

909 This section defines the structure and content of an ebXML Error Message that is contained
 910 within a *message reporting an error*.

911 **7.13.5.1 Message Structure**

912 An ebXML Error Message is created using the rules for creating an ebXML Message contained
 913 within this specification. In addition:

- 914 • the **MessageType** in the ebXML header is set to **Error**
- 915 • the payload consists of a single ebXML Error Document

916 **7.13.5.2 ebXML Error Document**

917 An ebXML Error Document has a root element that consists of:

- 918 • an **ErrorHeader** element that identifies the nature and severity of the error, and
- 919 • zero or more **ErrorLocation** elements, that identify the part(s) of the message(s) that are
 920 in error.

921 The structure of an ebXML Error Document is illustrated below.

```

922
923 <?xml version="1.0"?>
924 <ebXMLError xmlns="http://www.ebxml.org/namespaces/error"
925     Version="1.0">
926     <ErrorHeader>...</ErrorHeader>
927     <ErrorLocation>...</ErrorLocation>
928     <ErrorLocation>...</ErrorLocation>
929     ...
930 </ebXMLError>
    
```

931 Later versions of this specification may define how to report more than one error within an ebXML
 932 Error Document.

933 **7.13.5.3 Error Header Element**

934 The **ErrorHeader** element identifies the nature and severity of the error. It consists of the
 935 following attributes/elements.

936 **7.13.5.3.1 ID attribute**

937 The optional **ID** attribute uniquely identifies the **ErrorHeader** Element within the document.

938 **7.13.5.3.2 ErrorCode element**

939 The required **ErrorCode** element indicates the nature of the error in the *message in error*. Valid
 940 values for the **ErrorCode** are given in section 7.13.5.8.

941 **7.13.5.3.3 Severity element**

942 The required **Severity** element indicates the severity of the error. Valid values are:

- 943 • **Warning** - This indicates that although there is a message in error other messages in the
944 conversation will still be generated in the normal way.
- 945 • **Error** - This indicates that there is an unrecoverable error in the message in error and no
946 further messages will be generated as part of the conversation.

947 7.13.5.3.4 Description element

948 The optional **Description** element provides a narrative description of the error in the language
949 defined by the *xml:lang* attribute on the **Description** element. The content of this attribute is
950 defined by the vendor/developer of the software, which generated the ebXML Error Document.
951 *xml:lang* must comply with the rules for identifying languages specified in [XML].

952 7.13.5.3.5 SoftwareDetails element

953 The optional **SoftwareDetails** element contains a value that is set by the vendor/developer of the
954 software, which generated the ebXML Error Document. It SHOULD contain data that enables the
955 vendor/developer to identify the precise location in their software and the set of circumstances
956 that caused the software to generate a *message reporting the error*. It is RECOMMENDED that
957 this element include plain text to identify:

- 958 • the name of the software vendor;
- 959 • the name, version and release number of the software that generated the ebXML Error
960 Document
- 961 • the part of the software that caused the error to be generated which can be used by the
962 Software Vendor to identify the circumstances that caused the error

963 7.13.5.4 Examples

964 Two examples of an **ErrorHeader** element are given below.

```
965 <ErrorHeader ID='ab184832' >
966 <ErrorCode>UnableToParse</ErrorCode>
967 <Severity>Error</Severity>
968 <Description xml:lang='en-uk'>The "MessageManifest" element is not well formed.</Description>
969 <SoftwareDetails>Software Development Corp.; ebXML Connector!!; v2.7, build 2.7313; Ref
970 HA</SoftwareDetails>
971 </ErrorHeader>
```

```
974 <ErrorHeader ID='sdj2309823' >
975 <ErrorCode>NotSupported</ErrorCode>
976 <Severity>Error</Severity>
977 <Description>xml:lang='en-us'>Delivery Semantics of "OnceAndOnlyOnce" are not
978 supported.</Description>
979 <SoftwareDetails>Unreliable Software Development Corp.; ebXML Message Handler !!; v23.5, build 5751;
980 Ref: xapowekxd</SoftwareDetails>
981 </ErrorHeader>
```

982 7.13.5.5 Error Location Element

983 The **ErrorLocation** Element identifies the location of an error either within a message or
984 elsewhere.

985 Frequently a single **ErrorLocation** element will be all that is required within an ebXML Error
986 document. For example, an **ErrorCode** of **ValueNotRecognized** is likely to reference an element
987 or attribute and no other **ErrorLocation** element will be needed.

989

990 Sometimes though, multiple **ErrorLocation** elements will be required to define where the
 991 problem is. For example, an error code with a value of **Inconsistent** would frequently have two or
 992 more **ErrorLocation** elements that point to the various items that are inconsistent.
 993 The number of **ErrorLocation** elements included in an ebXML Error document is an
 994 implementation decision.

995
 996 An **ErrorLocation** element consists of the following attributes/elements:

- 997 • **ID** attribute
- 998 • **RefToMessageld** element
- 999 • **Href** element

1000 **7.13.5.5.1 ID Attribute**

1001 The optional **ID** attribute uniquely identifies the **ErrorLocation** element within the ebXML Error
 1002 document.

1003 **7.13.5.5.2 RefToMessageld element**

1004 The optional **RefToMessageld** element contains the **Messageld** from the ebXML Header
 1005 Document of the *message in error*. This must be present if a **Messageld** can be identified within
 1006 the *message in error*.

1007 **7.13.5.5.3 Href element**

1008 The **Href** URI identifies either some other location within the *message in error*, or elsewhere, that
 1009 helps identify the location of the error.

1010 **7.13.5.6 Examples**

1011 Two examples of an **ErrorLocation** element are given below. The first example is indicating that
 1012 the referenced message is inconsistent with a previously agreed Party Agreement.

```
1013 <ErrorLocation ID='4982hw'>
1014 <RefToMessageld>ab131982387123</RefToMessageld>
1015 <Href>url:example.com/tpa/471839<Href>
1016 </ErrorLocation>
```

1017
 1018 The second example is pointing to an error in an ebXML Header Document.

```
1019 <ErrorLocation ID='120938uqwe'>
1020 <RefToMessageld>ac198327123098</RefToMessageld>
1021 <Href>cid:-----8760<Href>
1022 </ErrorLocation>
```

1024 **7.13.5.7 ebXML Error Document Type Definition**

1025 The following is the DTD for the ebXML Error Document.

```
1026 <?xml version="1.0"?>
1027 <schema xmlns="http://www.w3.org/1999/XMLSchema">
1028 <!ELEMENT ebXMLError (ErrorHeader, ErrorLocation)*>
1029 <!ELEMENT ErrorHeader (ErrorCode, Severity, Description?, SoftwareDetails)>
1030 <!ATTLIST ErrorHeader
1031 ID NMTOKEN #IMPLIED
1032 <!ELEMENT ErrorCode (#PCDATA) > <-- string max 20 char -->
1033 <!ELEMENT Severity (#PCDATA) > <-- Either 'Warning' or 'Error' -->
1034 <!ELEMENT Description (#PCDATA) > <-- string max 1024 (?) char -->
1035 <!ATTLIST Description
1036 xml:lang NMTOKEN #REQUIRED >
1037 <!ELEMENT SoftwareDetails(#PCDATA) > <-- string max 16k (?) chars -->
1038 <!ELEMENT ErrorLocation (RefToMessageld?, Href) >
```

```

1040 <!ATTLIST ErrorLocation
1041 ID NMTOKEN #IMPLIED >
1042 <!ELEMENT RefToMessageId (#PCDATA) >
1043 <!ELEMENT Href (#PCDATA) >
    
```

1044 7.13.5.8 Error Codes

1045 This section describes the **ErrorCodes** (see section 7.13.5.3.2) that are used in a *message*
 1046 *reporting an error*. They are described as a list of bullet points. The following describes how to
 1047 interpret this list:

- 1048 • the first word is the actual **ErrorCode**, e.g. **UnableToParse**
- 1049 • the single sentence that immediately follows the error code is a "narrative" that describes
 1050 the **ErrorCode**, for example "XML not well formed or invalid".
- 1051 • the sentence(s) that follow the narrative, are the explanation of the meaning of the error
 1052 and provide guidance on when the particular **ErrorCode** should be used.
- 1053 • It is RECOMMENDED that implementers:
 - 1054 - use both the **ErrorCode** and the "narrative" to explain an error to, for example, a user
 - 1055 - translate the "narrative" into the preferred language of the recipient of *the message in*
 1056 *error* if this is known

1057 7.13.5.9 Reporting Errors in the ebXML Header Document

1058 The following list contains error codes that can be associated with XML documents, for example
 1059 the ebXML Header Document:

- 1060 • **UnableToParse** - XML not well formed or invalid. The XML document is not well formed
 1061 or not valid and cannot be successfully parsed. See [XML] for the meaning of "well
 1062 formed" and "not valid".
- 1063 • **ValueNotRecognized** - Element content or attribute value not recognized. Although the
 1064 document is well formed and valid, the element/attribute contains a value which could not
 1065 recognized and therefore could not be used by the ebXML Messaging Service
- 1066 • **NotSupported** - Element or attribute not supported. Although the document is well
 1067 formed and valid, an element or attribute is present that:
 - 1068 - is consistent with the rules and constraints contained in this specification, but
 - 1069 - is not supported by the ebXML Messaging Service that is processing the message.
- 1070 • **Inconsistent** - Element content or attribute value inconsistent with other elements or
 1071 attributes. Although the document is well formed and valid, according to the rules and
 1072 constraints contained in this specification the content of an element or attribute is
 1073 inconsistent with the content of other elements or their attributes.
- 1074 • **OtherXml** - Other error in an element content or attribute value. Although the document
 1075 is well formed and valid, the element content or attribute value contains values which do
 1076 not conform to the rules and constraints contained in this specification and is not covered
 1077 by other error codes. The **Description** element should be used to indicate the nature of
 1078 the problem.

1079 7.13.5.10 Non-XML Document Errors

1080 The following are error codes that identify errors that are not associated with an XML Document:

- 1081 • **MessageTooLarge** - Message too large. The message is too large to be processed by
 1082 the ebXML Messaging Service.

- 1083 • **MimeProblem** - A MIME error has occurred. An error has been detected in the structure
1084 or format of a MIME part of the message. For example:
 - 1085 - Missing MIME Part. Although the MIME message is correctly structured, a MIME part is
1086 missing that should have been present if the rules and constraints contained in this
1087 specification are followed
 - 1088 - Unexpected MIME Part. Unexpected MIME part. Although the MIME message is correctly
1089 structured, a MIME part is present that is not expected in the particular context
1090 according to the rules and constraints contained in this specification
 - 1091 • **Unknown** - Unknown Error. Indicates that an error has occurred that is not covered
1092 explicitly by any of the other errors. The **Description** element should be used to indicate
1093 the nature of the problem.
- 1094 Note this list will be expanded in future versions of this specification, for example to report errors
1095 on security.
1096

1097 7.14 Security

1098 This version of the specification supports limited security services, that is those security services
1099 that can be supported within the payload. The `multipart/related` payload may be
1100 encrypted using cryptographic techniques suitable for the payload type. Expanded definition of
1101 security will be addressed in the Phase 2.

1593 **Appendix C Candidate Packaging Technologies and** 1594 **Selection Process**

1595 The packaging sub-group began its investigation of packaging technologies by identifying the
 1596 technologies currently used for business-to-business message exchange or were being
 1597 developed for this purpose. The following packaging technologies were identified:

- 1598 • MIME - currently in use by companies exchanging business transactions using E-mail
 1599 and HTTP
- 1600 • XML - currently used by RosettaNet and Microsoft (BizTalk and SOAP) and others

1601 **C.1 Selection Process**

1602 Each candidate technology was evaluated based on its ability to meet the requirements listed in
 1603 the section titled "Packaging and other Requirements" in this document. When necessary,
 1604 specific parties were contacted to provide details describing how a technology was being used to
 1605 meet specific requirements. The following parties were contacted to provide expert insight:

- 1606 • Microsoft - David Turner, regarding use of XML packaging in BizTalk
- 1607 • Develop Mentor - Don Box, regarding use of XML packaging in SOAP
- 1608 • Vitria - Prasad Yendluri, regarding use of XML packaging in RosettaNet
- 1609 • Jonathan Borden - author of [XMTP], an XML to MIME transformation tool

1610
 1611 The packaging sub-group considered the inputs of people from the ebXML Transport mailing list
 1612 as well as the parties listed above, before making a selection.

1613 **C.2 MIME**

1614 Multipurpose Internet Mail Extensions (MIME) is an international standard created by the Internet
 1615 Engineering Task Force. It has been implemented by numerous software vendors across the
 1616 globe and has been used to exchange mixed type payloads, including XML, for several years.
 1617 MIME was designed purely as a packaging (enveloping) solution to allow the transport of mixed

1618 payloads using Internet E-mail (SMTP). MIME is also being used by other transport technologies
 1619 as a packaging technology, most notably HTTP.

1620 **C.3 XML**

1621 eXtensible Markup Language (XML) version 1.0 is a technical specification holding a
 1622 RECOMMENDED status created by the World Wide Web Consortium. It has been implemented
 1623 by numerous software vendors across the globe and has been used to describe a broad
 1624 spectrum of document structures from very simple to very complex. XML is a very flexible
 1625 markup language that can be used to represent virtually any type of document. XML can be used
 1626 solely for packaging (enveloping) documents of any type, providing the data can be "transformed"
 1627 into "legal" XML.

1628
 1629 In some cases, XML documents MUST be placed into transport specific "envelopes" before being
 1630 transported. For example, XML data MUST be placed in a MIME envelope when being
 1631 transported via SMTP or HTTP.

1632 **C.4 Conclusion**

1633 The packaging sub-group examined the capabilities of both XML and MIME relative to the list of
 1634 packaging requirements above. It's important to note that neither technology met all of the ebXML
 1635 requirements and in the end it was the packaging sub-groups assessment of which technology
 1636 came closest to meeting ALL of the ebXML requirements that determined which technology
 1637 SHOULD be used.

1638
 1639 MIME was chosen to serve as the ebXML packaging technology, over XML, based on the
 1640 information contained in the following table:

Reason	Requirement(s) Satisfied
There is no formal packaging recommendation within IETF or W3C, based on XML. If ebXML were to choose XML as a packaging technology it would be required to define an XML packaging specification and submit this to IETF or W3C for adoption as a formal standard.	to not reinvent the wheel - re-use where possible [TRPREQ]
XML requires that binary and other types of payload data including XML documents be base64 encoded in order to be encapsulated within a XML root document. Base64 encoding ensures that no illegal XML characters exist within a document and recursive XML documents are "hidden". Base64 encoding imposes a significant processing overhead and results in larger messages, which affect both transmission and processing times. Base64 encoding of binary data is required of MIME content when being transported by SMTP, but this is a transport level requirement, not a requirement imposed by MIME. Binary data can be packaged and transported without alteration when using MIME over HTTP	Minimize intrusion to payload (special encoding or alteration) Low processing overhead
At the time of defining this specification there is no industry standard way to package an encrypted message, or portion of a message, using XML.	All or part of the documents in a message MAY be encrypted prior to sending [TRPREQ]
MIME could be used in conformance within existing IETF recommendations, no additions or changes are	to not reinvent the wheel - re-use where possible [TRPREQ]

initially required to produce a functional envelope.	

1641 **Appendix D MIME Type discussion**

1642 Three MIME media types were considered to serve as Content-Type for the *ebXML Message*
 1643 *Envelope*:

- 1644 • Multipart/related
- 1645 • Multipart/Mixed
- 1646 • Multipart/form-data
- 1647 •

1648 **The group selected the multipart/related media type to serve as the preferred message**
 1649 **envelope Content-Type.**

1650
 1651 *Note:*

1652 *There was some discussion over the similarities of multipart/related and multipart/mixed, both of*
 1653 *which appear to offer similar capabilities and both could meet stated requirements. However, the*
 1654 *group converged on multipart/related, believing it to be more semantically appropriate for ebXML.*
 1655 *There was significant discussion over whether to support multipart/form-data as an alternate*
 1656 *Content-Type for message-envelope, due to the large installed base of web browsers that*
 1657 *support this Content-Type.*

1658
 1659 *It was determined that multipart/related was a more generic Content-Type than multipart/form-*
 1660 *data and the multipart/related Content-Type is the preferred Content-Type for ebXML Message*
 1661 *Envelopes. Multipart/form-data Content-Type is typically associated with HTTP/HTML web forms,*
 1662 *whereas multipart/related can be associated with any type of data.*

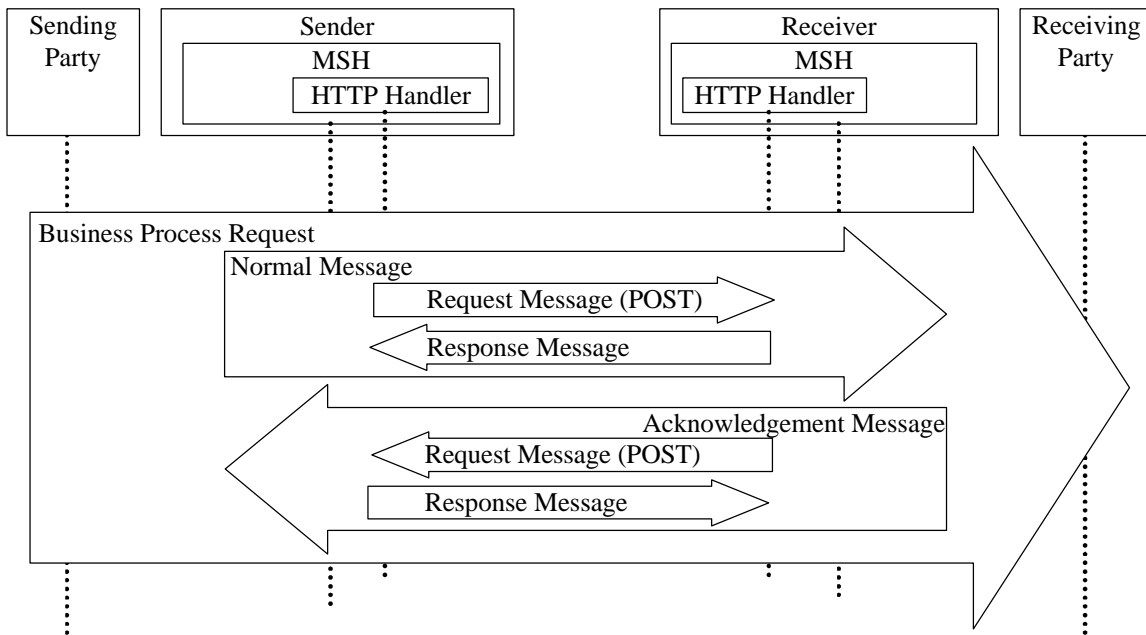

1663
 1664 Additionally, due to limitations in their handling of multipart ebXML payloads it was determined
 1665 that existing web browsers are unable to support the full breadth of functions needed to package
 1666 complex *ebXML Messages* containing multipart payloads. Therefore browser vendors are
 1667 encouraged to add support for the ebXML enveloping standard as specified in this document.

1668 **Appendix E Communication Protocol Interfaces**

1669 The ebXML Messaging Service messages are carried by Transport Protocols as shown in the
 1670 following sections.

1671 **E.1 HTTP [RFC 2068]**

1672 All ebXML Messaging Service messages are carried by an HTTP Request Message (POST
 1673 method). The HTTP Response Message to an HTTP Request Message has no entity body.
 1674 The following Figure E.1 shows how a Normal Message and its corresponding Acknowledgement
 1675 Message (when Reliable Messaging is used) are carried using HTTP:
 1676

1677
 1678
 1679
 1680

Figure E.1 HTTP Flow

Table E.1 Relationship with HTTP

<i>ebXML Messaging Service message</i>	<i>HTTP</i>
Normal Message	Request Message (POST method) from Sender to Receiver Response Message to the Request Message has no entity body
Acknowledgement Message	Request Message (POST method) from Receiver to Sender Response Message to the Request Message has no entity body

<p>Error Message</p>	<p>Request Message (POST method) from Receiver to Sender</p> <p>Response Message to the Request Message has no entity body</p>
----------------------	--

1681
1682
1683
1684

E.2 SMTP [RFC 821]

All ebXML Messaging Service messages are carried as mail in an SMTP Mail Transaction as shown in the following Figures.

1685
1686
1687
1688
1689
1690

Figure E.2 SMTP Flow

The Mail Transaction follows RFC 821, "SIMPLE MAIL TRANSFER PROTOCOL", as shown in the following Figure:

Figure E.3 SMTP Sequence

Table E.2 Relationship with SMTP

<i>ebXML Messaging Service message</i>	<i>SMTP</i>
Normal Message	Mail Transaction from Sender to Receiver
Acknowledgement Message	Mail Transaction from Receiver to Sender
Error Message	Mail Transaction from Receiver to Sender

E.3 FTP [RFC 959]

This section to be added.

E.4 Communication Protocol Errors during Reliable Messaging

When the Sender or the Receiver detects a transport protocol level error (such as an HTTP, SMTP or FTP error), the appropriate transport recovery handler will execute a recovery sequence. No Reliable Messaging functions are involved in this recovery sequence, since it happens at a lower level.

However, if the Sender detects a transport protocol level error that is unrecoverable at the transport protocol level, the appropriate recovery handler in the Sender will execute a Messaging Message Service Specification v0.21d

1705 Service recovery sequence. This recovery sequence SHALL use a retry interval and SHALL re-
1706 send the last message to the Receiver. The format of the re-sent message is exactly the same as
1707 the original message. In the recovery sequence or after the recovery sequence:

- 1708 - If the Sender detects a transport protocol level error again, which is unrecoverable at the
1709 transport protocol level, the recovery handler repeats the recovery sequence for an
1710 implementation-defined number of times.
- 1711 - If the Sender detects or receives another error, the recovery handler executes an
1712 appropriate recovery sequence for the error.
- 1713 - If the Sender receives an Acknowledgment Message, the message transmission is
1714 completed.

1715 **Figure E.4 Recovery Sequence for Communication Protocol Errors**

1716

1717 **Appendix F Detailed list of the Messaging Services**
1718 **Requirement Phases**
