**Abstract:**

This specification describes the program and technical requirements for SAML conformance.

**Status:**

This is an OASIS Standard document produced by the Security Services Technical Committee. It was approved by the OASIS membership on 2 September 2003.

Committee members should submit comments and potential errata to the [security-services@lists.oasis-open.org](mailto:security-services@lists.oasis-open.org) list. Others should submit them to the [security-services-comment@lists.oasis-open.org](mailto:security-services-comment@lists.oasis-open.org) list (to post, you must subscribe; to subscribe, send a message to [security-services-comment-request@lists.oasis-open.org](mailto:security-services-comment-request@lists.oasis-open.org) with "subscribe" in the body) or use

38 other OASIS-supported means of submitting comments. The committee will publish vetted errata  
39 on the Security Services TC web page (<http://www.oasis-open.org/committees/security/>).

40 For information on whether any patents have been disclosed that may be essential to  
41 implementing this specification, and any offers of patent licensing terms, please refer to the  
42 Intellectual Property Rights web page for the Security Services TC ([http://www.oasis-  
open.org/committees/security/ipr.php](http://www.oasis-<br/>43 open.org/committees/security/ipr.php)).

# 88 1 Introduction

89 This document describes the program and technical requirements for the SAML conformance system.

## 90 1.1 Scope of the Conformance Program

91 SAML deals with a rich set of functionalities ranging from assertions about acts of authentication to  
92 assertions for policy enforcement. Not all implementers will choose to implement all aspects of the SAML  
93 specifications. In order to achieve compatibility and interoperability, applications and software need to be  
94 measured for conformance in a uniform manner. The SAML conformance effort aims at fulfilling this need.

95 The deliverables of the SAML conformance effort include:

- 96 • Conformance clause, defining at a high level what conformance means for the SAML standard.
- 97 • Conformance program specification, defining how an implementation or application establishes  
98 conformance.
- 99 • Input to the creation of a conformance test suite. This is a high-level specification for a set of test  
100 programs, result files, and report generation tools that can be used by vendors of SAML-compliant  
101 software, buyers interested in confirming SAML compliance of software, and testing labs running  
102 conformance tests on behalf of vendors or buyers.

103 Section 2 of this document provides the SAML Conformance Clause. Section 3 deals with defining and  
104 specifying the process by which conformance to the SAML specification set can be demonstrated and  
105 certified. Section 4 elucidates the technical requirements that constitute conformance; this includes both  
106 the levels of conformance that can be demonstrated and the requirements for each of those levels of  
107 conformance. Section 5 describes what a test suite for SAML should include. Section 6 defines the  
108 services that may become available to assist in establishing conformance. Section 7 gives information for  
109 documents referenced in this specification.

## 110 1.2 Notation

111 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD  
112 NOT", "RECOMMENDED", "DOES", and "OPTIONAL" in this specification are to be interpreted as  
113 described in IETF RFC 2119 [**RFC2119**]:

114         ...they **MUST** only be used where it is actually required for interoperation or to limit behavior  
115         which has potential for causing harm (e.g., limiting retransmissions)...

116 These keywords are thus capitalized when used to unambiguously specify requirements over protocol and  
117 application features and behavior that affect the interoperability and security of implementations. When  
118 these words are not capitalized, they are meant in their natural-language sense.

---

## 119 2 Conformance Clause

120 The objectives of the SAML Conformance Clause are to:

- 121 • Ensure a common understanding of conformance and what is required to claim conformance
- 122 • Promote interoperability in the exchange of authentication and authorization information
- 123 • Promote uniformity in the development of conformance tests

124 The SAML Conformance Clause explicitly specifies all of the requirements that have to be satisfied to  
125 claim conformance to the SAML standard.

### 126 2.1 SAML Specification Set

127 The following four specifications, in addition to this SAML conformance program specification, comprise  
128 the Version 1.1 specification set for SAML:

- 129 • Assertions and Protocol for the OASIS Security Assertion Markup Language (SAML) [**SAMLCore**]
- 130 • Security Considerations for the OASIS Security Assertion Markup Language (SAML) [**SAMLSec**]
- 131 • Bindings and Profiles for the OASIS Security Assertion Markup Language (SAML) [**SAMLBind**]
- 132 • Glossary for the OASIS Security Assertion Markup Language (SAML) [**SAMLGloss**]

133 The SAML Core document also references the schema definitions for SAML assertions and protocols:

- 134 • Assertion schema [**SAMLAssertion**]
- 135 • Protocol schema [**SAMLProtocol**]

136 Although additional documents might use or reference the SAML standard (such as white papers,  
137 descriptions of custom profiles, and position papers referencing particular issues), they do not constitute  
138 part of the standard.

### 139 2.2 Declaration of SAML Conformance

140 Conformance to the SAML standard can be declared either for the entire standard or for a subset of the  
141 standard, based on the requirements that a given implementation or application claims to meet. That is,  
142 requirements can be applied at varying levels, so that a given implementation or application of the SAML  
143 standard can achieve clearly defined conformance with all or part of the entire set of specifications.

144 SAML conformance **MUST** be expressed in terms of which SAML bindings and profiles are supported by  
145 a given application or implementation. The application or implementation claiming conformance to the  
146 SAML standard **MUST** support the SOAP protocol binding for assertions containing at least one statement  
147 type. An application or implementation **MAY** also support the web browser profiles.

148 For any binding for which an application or implementation claims conformance, the level of conformance  
149 **MUST** then be specified in each of these dimensions:

- 150 • Whether the application or implementation acts as producer, consumer, or both producer and  
151 consumer of the SAML messages in the supported bindings and profiles.
- 152 • Which assertions and statements the application or implementation supports for each supported  
153 binding.

154 Table 1 shows the protocols, protocol bindings, and profiles applicable to each SAML assertion/statement  
 155 type. For each SAML binding or profile to which an application or implementation claims conformance, the  
 156 claim MUST stipulate whether the producer and/or consumer roles are supported and for which assertions  
 157 and statements for those roles.

158 Note that the OASIS Web Services Security Technical Committee has produced a draft “SAML token  
 159 profile” of the WSS specification [WSS-SAML], which describes how to use SAML assertions to secure a  
 160 web service message. This specification does not discuss conformance to that profile of SAML.

161 For example, an implementation consisting solely of an authentication authority responsible for generating  
 162 assertions containing authentication statements and returning those assertions in response to a SOAP-  
 163 over-HTTP request for assertion would correspond to the “producer role” for the SOAP over HTTP  
 164 binding. If the implementation also supported the return of the assertion in the browser/artifact profile, then  
 165 the “producer role” for that profile would also be supported.

166 A SAML protocol <Request> element may contain any one of <AuthenticationQuery>,  
 167 <AttributeQuery>, or <AuthorizationDecisionQuery> elements, or, it may contain any number  
 168 of <AssertionIDReference> or <AssertionArtifact> elements. For convenience, this document  
 169 refers to a SAML request with an <AuthenticationQuery> element as an “authentication query”, a  
 170 request with an <AttributeQuery> element as an “attribute query”, and a request with an  
 171 <AuthorizationDecisionQuery> element as an “authorization decision query”. SAML requests  
 172 containing <AssertionIDReference> or <AssertionArtifact> elements are referred to simply as  
 173 requests of those types.

174

175 **Table 1: Protocol Bindings and Profiles for SAML Assertions**

Binding or Profile	Consumer Role	Producer Role
<b>SOAP over HTTP protocol binding</b>	Send an authentication query to solicit an assertion containing an authentication statement from a producer; consume the returned response and assertion.	Produce an assertion containing an authentication statement and return a response containing the assertion to the consumer.
	Send an attribute query to solicit an assertion containing an attribute statement from a producer; consume the returned assertion.	Produce an assertion containing an attribute statement and return a response containing the assertion to the consumer.
	Send an authorization decision query to solicit an assertion containing an authorization decision statement from a producer; consume the returned assertion.	Produce an assertion containing an authorization decision statement and return a response containing the assertion to the consumer.
	Send an <AssertionIDReference> request to solicit one or more assertions with the associated assertion identifiers from a producer; consume the returned assertions.	Produce a response containing existing assertions with the requested assertion identifiers; send response to the consumer.
<b>Browser/Artifact Profile</b>	Receive one or more artifacts; send an <AssertionArtifact> request; ensure that returned assertions	Produce assertions including an SSO assertion and send corresponding artifacts to a consumer; on receiving

	include a single sign-on assertion; consume the returned assertions.	an <AssertionArtifact> request, produce a response containing the associated assertions; send response to the consumer.
<b>Browser/POST Profile</b>	Receive a response message containing one or more assertions including an SSO assertion in a POST message and consume the assertions.	Produce assertions including an SSO assertion; produce a response message containing the assertions; transfer the response to a consumer via a POST message

176

177 An application or implementation should express its level of conformance in terminology such as the  
178 following:

179 [Application or implementation] as both producer and consumer supports all SAML protocol  
180 bindings and profiles, for all assertions, statements, and required elements. No optional  
181 elements for the assertions, statements, bindings, and profiles are produced.

182 [Application or implementation] as both producer and consumer supports the SOAP protocol  
183 binding for all queries, assertions, and statements. It produces the <Conditions> optional  
184 elements for all assertions in the SOAP protocol binding. It does not support the browser  
185 profiles for any assertion.

186 [Application or implementation] as both producer and consumer supports the SOAP protocol  
187 binding for all assertions and statements. It also supports the browser/artifact profile and all  
188 required elements. No optional elements for the assertions, statements, bindings, and profiles  
189 are produced.

190 An application or implementation that claims conformance for a particular binding or profile MUST support  
191 all required elements of that binding or profile and of the assertions supported with that binding or profile.  
192 It MUST also state which assertions and statements are supported and which, if any, optional elements for  
193 that binding or profile and corresponding assertions and statements are supported.

## 194 2.3 Mandatory/Optional Elements in SAML Conformance

195 The SOAP protocol binding MUST be implemented by all implementations or applications claiming SAML  
196 conformance, for each assertion and statement type claimed as supported through a binding or profile.

197 The SAML schema and binding specifications include both mandatory and optional elements. A  
198 conforming application or implementation MUST be able to handle all valid SAML elements, including  
199 those that are optional. However, it does not have to produce those optional elements.

200 For example:

- 201 • An application or implementation that consumes assertions must be able to handle assertions that  
202 include the optional <Condition> element, such as by rejecting any conditions that it does not  
203 recognize.
- 204 • An application or implementation that produces assertions may, but is not required to, include the  
205 optional <Condition> element in those assertions.
- 206 • An application or implementation claiming support for an assertion must support the SOAP over HTTP  
207 protocol binding. It can also, optionally, implement the protocol by means of another binding.

208 The test cases for SAML conformance are intended to check for support of all valid SAML elements. They  
209 also check whether an implementation or application accepts and properly handles optional assertion  
210 elements (such as <Condition>) whose value the implementation or application does not recognize.

## 211 **2.4 Impact of Extensions on SAML Conformance**

212 SAML supports extensions to assertions, statements, protocols, protocol bindings, and profiles. An  
213 application or implementation MAY claim conformance to SAML only if its extensions (if any) meet the  
214 following requirements:

- 215 • Extensions MUST NOT re-define semantics for existing functions.
  - 216 • Extensions MUST NOT alter the specified behavior of interfaces defined in the SAML specification  
217 set.
  - 218 • Extensions MAY add additional behaviors.
  - 219 • Extensions MUST NOT cause standard-conforming functions (i.e., functions that do not use the  
220 extensions) to execute incorrectly.
- 221 SAML bindings and profiles MAY be extended so long as the above conditions are met. If a system is  
222 extending SAML assertions or statements:
- 223 • The mechanism for determining application conformance and the extensions MUST be clearly  
224 described in the documentation, and the extensions MUST be marked as such;
  - 225 • Extensions MUST follow the spirit, principles, and guidelines of the SAML specification set, that is, the  
226 specifications MUST be extended in a standard manner as defined in the extension fields.
  - 227 • In the case where an implementation has added additional behaviors, the implementation MUST  
228 provide a mechanism whereby a conforming application shall be recognized as such, and be  
229 executed in an environment that supports the functional behavior defined in this specification set.

230 Extensions are outside the scope of conformance. There are no mechanisms specified to validate and  
231 verify the extensions.

## 232 **2.5 Maximum Values of Unbounded Elements**

233 The SAML schema supports a number of elements that can be specified multiple times in an assertion,  
234 request or response. An application or implementation claiming conformance MUST support at least the  
235 values listed in Table 2 below for each of the elements defined as “unbounded” in the SAML schema. In  
236 those cases where the maximum value is greater than the listed values, the application or implementation  
237 SHOULD state what that maximum supported value is.

238 However, some of the elements in the table can be nested, such that repeated elements have a  
239 multiplicative effect on the number of elements. For example, trees of nested unbounded elements  
240 include the following:

- 241 Response > Assertion > Statement (of various types)
- 242 Response > Assertion > Advice > Assertion
- 243 Response > Assertion > Conditions > AudienceRestrictionCondition > Audience
- 244 Response > Assertion > Statement > SubjectConfirmation > ConfirmationMethod
- 245 Response > Assertion > AttributeStatement > Attribute > AttributeValue

246 In a response containing 10 assertions, each with 10 AttributeStatements, each with 10 Attributes, each  
247 with 10 AttributeValues, this tree alone comprises 10,000 elements.

248 Therefore, in order to minimize the potential impact of nested unbounded elements, an application or  
249 implementation MAY limit the total number of elements supported in a given request, response or (when  
250 this is used in the POST profile) assertion to no more than 1000 total elements and still claim  
251 conformance to the SAML V1.1 specification set.

**Table 2: Unbounded Elements**

<b>Element</b>	<b>Parent Element</b>	<b>Maximum Value</b>
Statement (various types)	Assertion	1000
DoNotCacheCondition	Conditions	1000
AudienceRestrictionCondition	Conditions	1000
Audience	AudienceRestrictionCondition	1000
AssertionIDReference	Advice	1000
Assertion	Advice	1000
ConfirmationMethod	SubjectConfirmation	1000
AuthorityBinding	AuthenticationStatement	1000
Attribute	AttributeStatement	1000
AttributeValue	Attribute	1000
Action	AuthorizationDecisionStatement	1000
AssertionIDReference	Evidence	1000
Assertion	Evidence	1000
RespondWith	Request	1000
AssertionIDReference	Request	1000
AssertionArtifact	Request	1000
AttributeDesignator	AttributeQuery	1000
Action	AuthorizationDecisionQuery	1000
Assertion	Response	1000

254

---

## 3 Conformance Process

255 As discussed in the article “What is this thing called conformance” [NIST/ITL], conformance can comprise  
256 any of several levels of formal process:

- 257 • **Conformance testing** (also called conformity assessment) is the execution of automated or non-  
258 automated scripts, processes, or other mechanisms to determine whether an application or  
259 implementation of a specification deviates from that specification. Conformance testing performed by  
260 implementors early on in the development process can find and correct their errors before the  
261 software reaches the marketplace, without necessarily being part of either a validation or a  
262 certification process.
- 263 • **Validation** is the process of testing software for compliance with applicable specifications or  
264 standards. The validation process consists of the steps necessary to perform the conformance testing  
265 by using an official test suite in a prescribed manner.
- 266 • **Certification** is the acknowledgment that a validation has been completed and the criteria established  
267 by the certifying organization for issuing a certificate have been met. Successful completion of  
268 certification results in the issuance of a certificate (or brand) indicating that the implementation  
269 conforms to the appropriate specification. It is important to note that certification cannot exist without  
270 validation, but validation can exist without certification.

271 The conformance process for SAML is based on validation rather than certification. That is, no certifying  
272 organization has been established with the responsible for issuing a statement of conformance with regard  
273 to an application or implementation. Therefore, an implementor who has validated SAML conformance by  
274 means of conformance testing **MUST NOT** use the term “certified for SAML conformance”. Until and if a  
275 certification process is in place, vendor declaration of validation will be the only means of asserting that  
276 conformance testing has been performed.

277 The conformance process does not stipulate whether validation is performed by the implementor, by a  
278 third party, or by the customer of an application or implementation. Rather, the conformance process  
279 describes the way in which conformance testing should be done in order to demonstrate that an  
280 application or implementation correctly performs the functionality specified in the standard. Validation  
281 achieved through the SAML conformance process provides software developers and users assurance and  
282 confidence that the product behaves as expected, performs functions in a known manner, and possesses  
283 the prescribed interface or format.

284 The Security Services Technical Committee is responsible for generating the materials that allow vendors,  
285 customers, and third parties to evaluate software for SAML conformance. These materials include  
286 documentation describing test cases, linked to use cases and requirements, included in this specification.

287 The test cases can be used to create a test suite that can be run against an implementation to  
288 demonstrate any of the several levels of conformance defined in the conformance clause of the SAML  
289 specification. The Security Services Technical Committee is not responsible for developing the test suite  
290 nor for testing of particular implementations.

### 3.1 Implementation and Application Conformance

292 SAML Conformance is applicable to:

- 293 • Implementations of SAML assertions, statements, protocols and bindings. These could be in the form  
294 of toolkits, products incorporating SAML components, or reference implementations that demonstrate  
295 the use of SAML components.

- 296 • Applications that produce or consume SAML protocol bindings or that execute on SAML  
297 implementations (for example, using a SAML toolkit to support multi-domain single sign-on)

298 A conforming **implementation** MUST meet all the following criteria:

- 299 1. The implementation MUST support all the required interfaces defined within the specification set for a  
300 given binding or profile. It MUST also specify which assertions and statements relevant to that binding  
301 or profile are supported. The implementation MUST support the functional behavior described in the  
302 specification.
- 303 2. The implementation MAY provide additional or enhanced facilities not required by this specification  
304 set. These nonstandard extensions MUST NOT alter the specified behavior of interfaces defined in  
305 this specification. They MAY add additional behaviors. In these circumstances, the implementation  
306 MUST provide a mechanism whereby a SAML conforming application shall be recognized as such,  
307 and be executed in an environment that supports the functional behavior defined in this specification  
308 set.

309 A conforming **application** MUST meet all the following criteria:

- 310 1. The application MUST be able to execute on any conforming implementation.
- 311 2. If an application requires a particular feature set that is not available on a specific implementation,  
312 then the application MUST act within the bounds of the SAML specification set, even though that  
313 means that the application does not perform any useful function. Specifically, the application MUST  
314 do no harm, and MUST correctly return resources and vacate memory upon discovery that a required  
315 element is not present.

## 316 **3.2 Process for Declaring Conformance**

317 The following process is to be followed in declaring that an application or implementation conforms to the  
318 SAML standard:

- 319 1. Determine which bindings and protocols will be asserted as conforming.
- 320 2. Implement the test suite for the conformance tests relevant to the conformance being claimed.
- 321 3. Validate the application or implementation by executing those conformance tests.
- 322 4. Send the statement claiming conformance to the Security Services Technical Committee so that it can  
323 be posted on the SAML web site. A statement of any bindings and profiles being used that are not part  
324 of the SAML standard should also be sent to the Security Services Technical Committee at the same  
325 time for posting on the SAML web site.

326

---

## 4 Technical Requirements for SAML Conformance

327  
328  
329

This section defines the technical criteria that apply to declaring conformance to the SAML standard. The requirements are specified as test cases, corresponding to the 12 possible subsets of conformance defined in Table 1.

330

Each test case includes:

331  
332

- A description of the test purpose (that is, what is being tested – the conditions, requirements, or capabilities which are to be addressed by a particular test)

333

- The pass/fail criteria

334

- A reference to the requirement in the requirements document relevant to the test case

335  
336

- A reference to the section in the specification set from which the test case is derived (that is, traceability back to the specification)

337  
338

For each assertion and statement type, both required tests for producing and consuming the assertion, as well as tests related to protocols, bindings, and profiles, are specified.

339

### 4.1 Test Group 1 – SOAP over HTTP Protocol Binding

340  
341  
342  
343

The test cases in this test group check for conformance to the SAML SOAP protocol binding. Any implementation or application claiming conformance to SAML MUST be able to execute these test cases successfully for the claimed assertion or assertions and role (producer or consumer), even if support for this protocol binding is incidental to the primary purposes of the application or implementation.

344  
345  
346

For convenience, assertions containing an authentication statement will be referred to in this section as *authentication assertions*, assertions containing an attribute statement as *attribute assertions*, and assertions containing an authorization decision statement as *authorization decision assertions*.

347

348

#### 4.1.1 Test Case 1-1: SOAP Binding: Implementation-Under-Test Produces Valid Authentication Assertion in Valid Response to Authentication Query

349  
350

351  
352  
353

**Description:** This test case requests and receives an authentication assertion created by an implementation-under-test using an authentication query in the SOAP binding. It then confirms that the authentication assertion returned by the implementation-under-test is valid for all required functionality.

354  
355  
356

**Pass/Fail Criteria:** The authentication assertion contains all required elements in the correct format and sequence, the authentication query is accepted by implementation-under-test, and the response contains all required elements in correct sequence.

357

**Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

358

**Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

359  
360

**Implementation Notes:** The implementation-under-test executes the authentication assertion producer role.

361 **4.1.2 Test Case 1-2: SOAP Binding: Implementation-Under-Test Consumes**  
362 **Valid Authentication Assertion, Requested in Valid Authentication Query**

363 **Description:** This test case receives an authentication query created by an implementation-under-test in  
364 the SOAP binding. It confirms that the authentication query is valid for all required functionality. The test  
365 case returns an authentication assertion and confirms that the assertion is consumed.

366 **Pass/Fail Criteria:** The authentication query contains all required elements in the correct format and  
367 sequence; the authentication response and assertion are consumed.

368 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

369 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

370 **Implementation Notes:** The implementation-under-test executes the authentication assertion consumer  
371 role. It is up to the test program and implementation-under-test to determine how to validate that the  
372 assertion was consumed.

373 **4.1.3 Test Case 1-3: SOAP Binding: Implementation-Under-Test Produces**  
374 **Valid Attribute Assertion in Valid Response to Attribute Query**

375 **Description:** This test case requests and receives an attribute assertion created by an implementation-  
376 under-test using an attribute query in the SOAP binding. It then confirms that the attribute assertion  
377 returned by the implementation-under-test is valid for all required functionality.

378 **Pass/Fail Criteria:** The attribute assertion contains all required elements in the correct format and  
379 sequence, the attribute query is accepted by implementation-under-test, and the response contains all  
380 required elements in correct sequence.

381 **Requirements Reference:** R-AUTHZ and R-MULTIDOMAIN

382 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

383 **Implementation Notes:** The implementation-under-test executes the attribute assertion producer role.

384 **4.1.4 Test Case 1-4: SOAP Binding: Implementation-Under-Test Consumes**  
385 **Valid Attribute Assertion, Requested in Valid Attribute Query**

386 **Description:** This test case receives an attribute query sent by an implementation-under-test in the SOAP  
387 binding. It confirms that the attribute query is valid for all required functionality. The test case then returns  
388 an attribute assertion and confirms that the assertion is consumed.

389 **Pass/Fail Criteria:** The attribute query contains all required elements in the correct format and sequence;  
390 attribute response and assertion are consumed.

391 **Requirements Reference:** R-AUTHZ and R-MULTIDOMAIN

392 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

393 **Implementation Notes:** The implementation-under-test executes the attribute assertion consumer role. It  
394 is up to the test program and implementation-under-test to determine how to validate that assertion was  
395 consumed.

396 **4.1.5 Test Case 1-5: SOAP Binding: Implementation-Under-Test Produces**  
397 **Valid Authorization Decision Assertion in Valid Response to**  
398 **Authorization Decision Query**

399 **Description:** This test case requests and receives an authorization decision assertion created by an  
400 implementation-under-test using an authorization decision query in the SOAP binding. It then confirms  
401 that the authorization decision assertion returned by the implementation-under-test is valid for all required  
402 functionality.

403 **Pass/Fail Criteria:** The authorization decision assertion contains all required elements in the correct  
404 format and sequence, the authorization decision query is accepted by implementation-under-test, and the  
405 response contains all required elements in correct sequence.

406 **Requirements Reference:** R-AUTHZDECISION and R-MULTIDOMAIN

407 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

408 **Implementation Notes:** The implementation-under-test executes the authorization decision assertion  
409 producer role.

410 **4.1.6 Test Case 1-6: SOAP Binding: Implementation-Under-Test Consumes**  
411 **Valid Authorization Decision Assertion, Requested in Valid Authorization**  
412 **Decision Query**

413 **Description:** This test case receives an authorization decision query created by an implementation-under-  
414 test in the SOAP binding. It confirms that the received authorization decision query is valid for all required  
415 functionality. It returns an authorization decision assertion to the implementation-under-test and confirms  
416 that the assertion is consumed.

417 **Pass/Fail Criteria:** The authorization decision query contains all required elements in the correct format  
418 and sequence; authorization decision response and assertion are consumed.

419 **Requirements Reference:** R-AUTHZDECISION and R-MULTIDOMAIN

420 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

421 **Implementation Notes:** The implementation-under-test executes the authorization decision assertion  
422 consumer role. It is up to the test program and implementation-under-test to determine how to validate  
423 that assertion was consumed.

424 **4.1.7 Test Case 1-7: SOAP Binding: Implementation-Under-Test Produces**  
425 **Valid Assertions in Valid Response to AssertionIDReference Request**

426 **Description:** This test case requests and receives assertions created by an implementation-under-test  
427 using an AssertionIDReference request in the SOAP binding. It then confirms that the assertions returned  
428 by the implementation-under-test are valid for all required functionality.

429 **Pass/Fail Criteria:** The returned assertions contain all required elements in the correct format and  
430 sequence, the AssertionIDReference request is accepted by implementation-under-test, and the response  
431 contains all required elements in correct sequence.

432 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

433 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

434 **Implementation Notes:** The implementation-under-test executes the assertion producer role.

435 **4.1.8 Test Case 1-8: SOAP Binding: Implementation-Under-Test Consumes**  
436 **Valid Assertions, Requested in Valid AssertionIDReference Request**

437 **Description:** This test case receives an AssertionIDReference request in the SOAP binding created by an  
438 implementation-under-test. It confirms that the received AssertionIDReference request is valid for all  
439 required functionality. The test case returns the requested assertions and confirms that the assertions are  
440 consumed.

441 **Pass/Fail Criteria:** The AssertionIDReference request contains all required elements in the correct format  
442 and sequence; the response and assertions are consumed.

443 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

444 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 3.1

445 **Implementation Notes:** The implementation-under-test executes the assertion consumer role. It is up to  
446 the test program and implementation-under-test to determine how to validate that assertions were  
447 consumed.

448 **4.2 Test Group 2 – Web Browser SSO Profiles**

449 The test cases in this test group check for conformance to the web browser single sign-on (SSO) profiles  
450 of the SAML standard. Both the browser/artifact and browser/POST profiles are optional. Any  
451 implementation or application claiming conformance to the browser/artifact profile MUST be able to  
452 execute Test Case 2-1 successfully for the assertion producer role and/or Test Case 2-2 successfully for  
453 the assertion consumer role. Any implementation or application claiming conformance to the  
454 browser/POST profile MUST be able to execute Test Case 2-3 successfully for the assertion producer role  
455 and/or Test Case 2-4 successfully for the assertion consumer role.

456 **4.2.1 Test Case 2-1: Browser/Artifact Profile: Valid Assertions Produced in**  
457 **Response to Valid AssertionArtifact Request**

458 **Description:** This test case receives artifacts in a valid HTTP message from an implementation-under-  
459 test. The test case confirms that the artifacts are valid for all required functionality. It then uses the  
460 AssertionArtifact request in the SOAP binding to request and receive assertions created by an  
461 implementation-under-test corresponding to the artifacts. It then confirms that the returned assertions  
462 include an SSO assertion and is valid for all required functionality.

463 **Pass/Fail Criteria:** .Received artifacts have expected formats. AssertionArtifact request contains all  
464 required elements in correct format and sequence and is accepted by the implementation-under-test; An  
465 assertion is returned for every artifact in the AssertionArtifact request. Returned assertions include an  
466 SSO assertion.

467 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

468 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 4.1.1

469 **Implementation Notes:** Test program performs the destination site (consumer) operations for the profile;  
470 implementation-under-test performs source site (producer) operations.

471 **4.2.2 Test Case 2-2: Browser/Artifact Profile: Valid Assertions Request**  
472 **Corresponding to Valid Artifacts Sent in Valid HTTP Message**

473 **Description:** This test case sends valid artifacts in a valid HTTP message to an implementation-under-  
474 test. The test case then receives an AssertionArtifact request containing the artifacts from the

475 implementation-under-test. It confirms that the AssertionArtifact request is valid for all required  
476 functionality, then returns the requested assertions to the implementation-under-test, and confirms that the  
477 assertion was consumed.

478 **Pass/Fail Criteria:** AssertionArtifact request contains all required elements in the correct format and  
479 sequence.

480 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

481 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 4.1.1

482 **Implementation Notes:** Test program performs the source site (producer) operations for the profile;  
483 implementation-under-test performs destination site (consumer) operations.

#### 484 **4.2.3 Test Case 2-3: Browser/POST Profile: Valid Assertions Received in** 485 **Valid HTTP POST**

486 **Description:** This test case receives an HTTP POST message from an implementation-under-test  
487 containing a SAML protocol response message with one or more assertions and including an SSO  
488 assertion and checks that the assertions are valid.

489 **Pass/Fail Criteria:** SSO assertion sent by implementation-under-test MUST contain all required  
490 information in the right sequence and format. Any optional information included (including conditions)  
491 MUST NOT compromise the validity of the required information.

492 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

493 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 4.1.2

494 **Implementation Notes:** Test program (consumer role) implementing this test case establishes  
495 successful execution of the test case by inspection of the format of the returned assertion.

#### 496 **4.2.4 Test Case 2-4: Browser/Post Profile: Valid Assertions Sent in Valid** 497 **HTTP POST**

498 **Description:** This test case sends a SAML protocol response message in an HTTP POST message to an  
499 implementation-under-test containing an SSO and other assertions and checks that the assertions are  
500 consumed.

501 **Pass/Fail Criteria:** Implementation-under-test allows access based on assertions it receives and  
502 consumes.

503 **Requirements Reference:** R-AUTHN and R-MULTIDOMAIN

504 **Specification Reference:** [SAMLCore] Sections 2.3, 2.4, and 3; [SAMLBind] Section 4.1.2

505 **Implementation Notes:** It is up to the test program and implementation-under-test to determine how to  
506 validate that assertion was consumed.

507

---

## 5 Test Suite

508 A test suite, which is the combination of test cases and test documentation, is used to check whether an  
509 implementation or application satisfies the requirements in the standard. The test cases, implemented by  
510 a test tool or a set of files (such as data, programs, scripts, or instructions for manual action), check each  
511 requirement in the specification to determine whether the results produced by the implementation or  
512 application match the expected results, as defined by the specification.

513 The test documentation describes how the testing is to be done and the directions for the tester to follow.  
514 Additionally, the documentation should be detailed enough so that testing of a given implementation can  
515 be repeated with no change in test results.

516 Conformance testing is black-box testing to test the functionality of an implementation. This means that  
517 the internal structure or the source code of a candidate implementation is not available to the tester.  
518 However, content and format of received or returned messages can be inspected as part of the  
519 determination of conformance.

520 Any test suite for SAML should consist of platform independent, non-biased, objective tests. Generally, a  
521 conformance test suite is a collection of combinations of legal and illegal inputs to the implementation  
522 being tested, together with a corresponding collection of expected results. Only the requirements  
523 specified in the standard are testable. A test suite should not check any implementation properties that  
524 are not described by the standard or set of standards. A test suite cannot require features that are optional  
525 in a standard, but if such features are present, a test suite could include tests for those features. A test  
526 suite does not assess the performance of an implementation unless performance requirements are  
527 specified in the specification, although implementation dependencies or machine dependencies can be  
528 demonstrated through the execution of the test cases.

529 The results of conformance testing apply only to the implementation and environment for which the tests  
530 are run. Test suites can be provided as a web-based system executed on a remote server, downloadable  
531 files for local execution, or a combination of remote and local access and execution. The method for  
532 providing and delivering the test suite depends on what is being tested as well as the objective for test  
533 suite use – that is, providing self-test capability or formal certification testing.

---

534

## 6 Conformance Services

535 The OASIS Security Services Technical Committee does not itself provide conformance services. As  
536 SAML test suites become available and experience with SAML identified appropriate conformance testing  
537 approaches, the Conformance Specification will describe the services which a conformance services  
538 organization should provide, including software services, releases, self-test kit, actual computer systems,  
539 facilities, web based interfaces, and availability.

## Appendix B. Notices

598 OASIS takes no position regarding the validity or scope of any intellectual property or other rights that  
599 might be claimed to pertain to the implementation or use of the technology described in this document or  
600 the extent to which any license under such rights might or might not be available; neither does it represent  
601 that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to  
602 rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made  
603 available for publication and any assurances of licenses to be made available, or the result of an attempt  
604 made to obtain a general license or permission for the use of such proprietary rights by implementors or  
605 users of this specification, can be obtained from the OASIS Executive Director.

606 OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or  
607 other proprietary rights which may cover technology that may be required to implement this specification.  
608 Please address the information to the OASIS Executive Director.
